Article Review

Introduction

In *The Impact of Social Media on College Students' Academic Performance*, Brown and Wilson (2023) examine how social media use affects students' academic success. The study explores both the positive and negative effects of social media on learning and time management.

Summary

The researchers surveyed 400 college students using questionnaires about their daily social media habits and grade point averages. The findings showed that moderate social media use can support communication and collaboration, while excessive use is associated with lower academic performance due to reduced study time and increased distractions.

Evaluation

The article is well organized and supported by current research. The authors explain their methodology clearly and use statistical evidence to support their conclusions. However, because the study relies on self-reported data, some responses may not be completely accurate.

Conclusion

Overall, the article provides useful insights into the relationship between social media use and academic performance. Despite its limitations, the research offers practical recommendations for students and educators seeking to promote healthier digital habits. It is a valuable source for anyone interested in educational technology and student success.
