

### **Activity / Passion Essay**

Tutoring younger students in mathematics and science has been one of the activities that has influenced me greatly. What was initially created as an effort to help others slowly turned into a booster of my patience and adaptability, as well as a source of effective communication. This experience taught me that listening and observing as much as explaining are part of teaching.

Students had different approaches to problems. Others needed a thorough, step-by-step explanation, and others worked better with visual examples or real-world examples. If I knew how to adapt my style to every person, I would have learned that the process of learning is not about how fast I learn, but rather about how clear and relevant I can be. Eventually, I would be more sensitive to their intellectual nuances and recognize when confusion posed as confidence or when frustration prevented progress.

Tutoring also changed my perception of learning itself. The explanation of concepts helped me to identify gaps in my understanding and prompted me to think critically about solutions. There is a feeling of increased comfort I got about admitting I did not have an answer, and a greater desire to journey and discover it. This experience reminded me that sometimes you must learn to be limited so that you can embrace the challenges of being a curious learner instead of a frightened one.

Moreover, it is an experience that has affected my interaction with classrooms and teamwork. I know better how other people handle information and am more oblivious to share ideas at the expense of colleagues. Tutoring provided me with the understanding that knowledge is strongest when distributed, and that significant results can be achieved by consistently taking small steps.
